Website Footprinting & Metadata Extraction

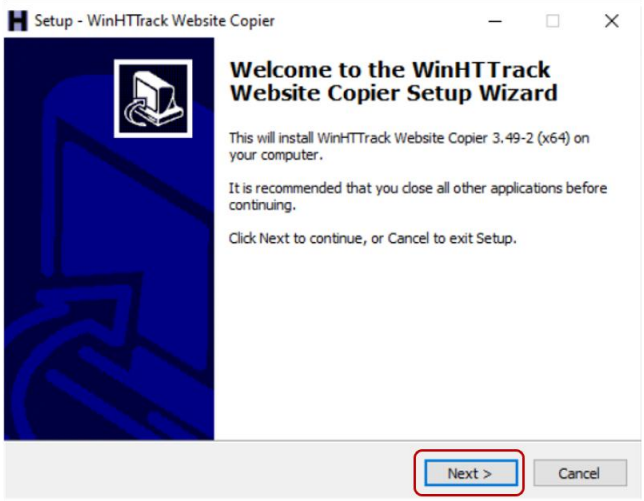

What is HTTrack

HTTrack is a free, open-source website mirroring tool that saves a complete copy of any website on the local machine — preserving the exact same structure as the original site. This tool is used in Threat Intelligence collection because it allows us to analyze a target website's source code, directory structure, CSS files, JavaScript files, images, and metadata offline without repeatedly connecting to the internet. Both attackers and analysts use it for website foot printing to gather an organization's technical information.

Objective: To mirror the website certifiedhacker.com and analyze its directory structure, source code, and linked files for data collection purposes.

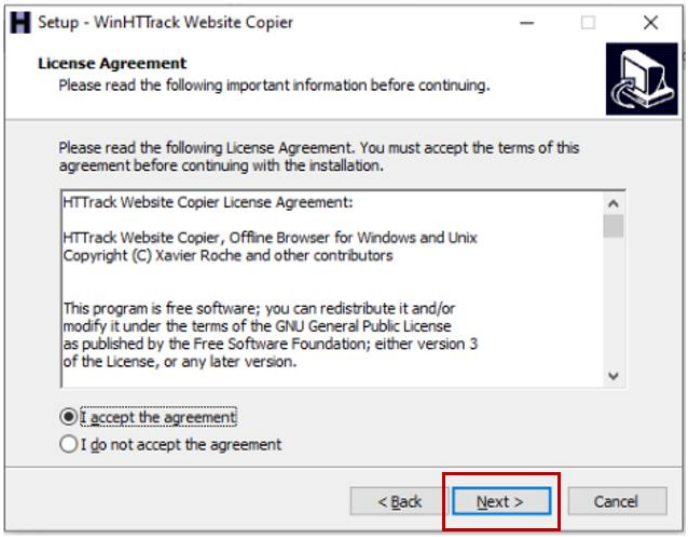

Setup wizard launched.

The WinHTTrack Website Copier setup wizard opened, confirming that version 3.49-2 (x64) was ready to install. Clicked **Next** to begin installation.

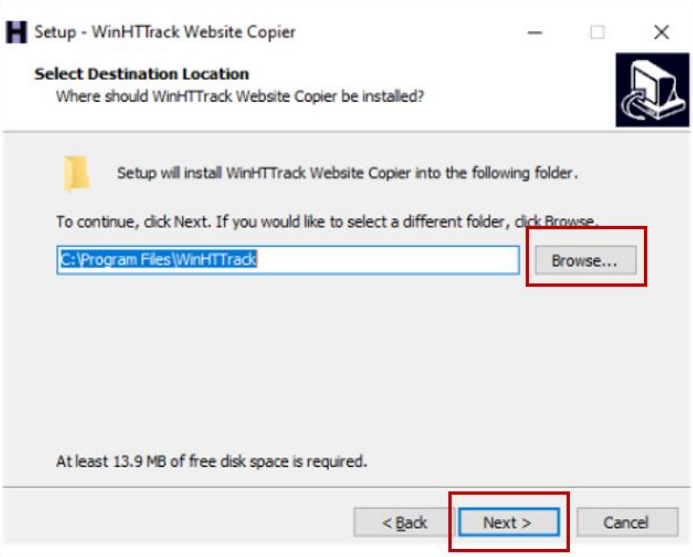

License Agreement screen.

Read the License Agreement. Selected **"I accept the agreement"** and clicked **Next**.

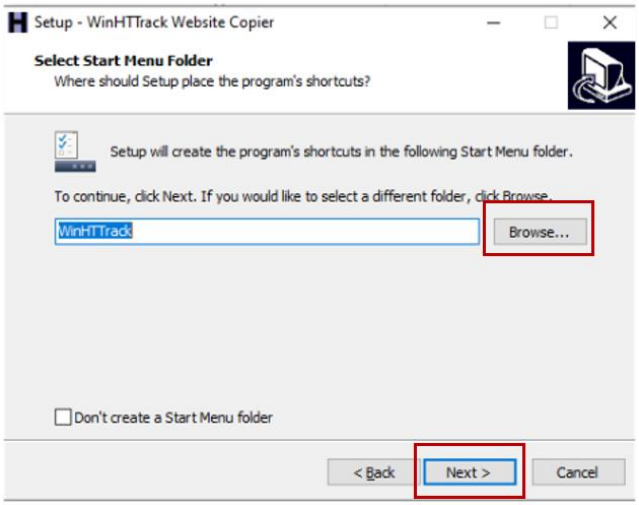

Selected destination location.

The default installation path C:\Program Files\WinHTTrack was already set. Kept the path unchanged and clicked Next.

Selected Start Menu folder.

The default folder name **"WinHTTrack"** was set for the Start Menu. No changes were made. Clicked **Next**.

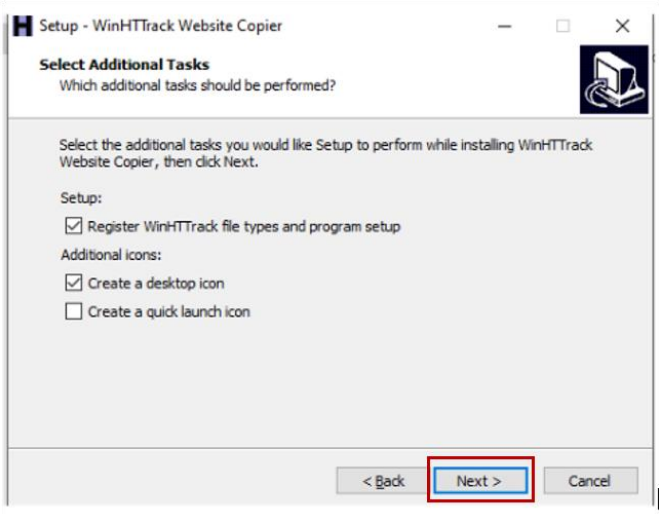

Additional Tasks screen.

Two options were checked:

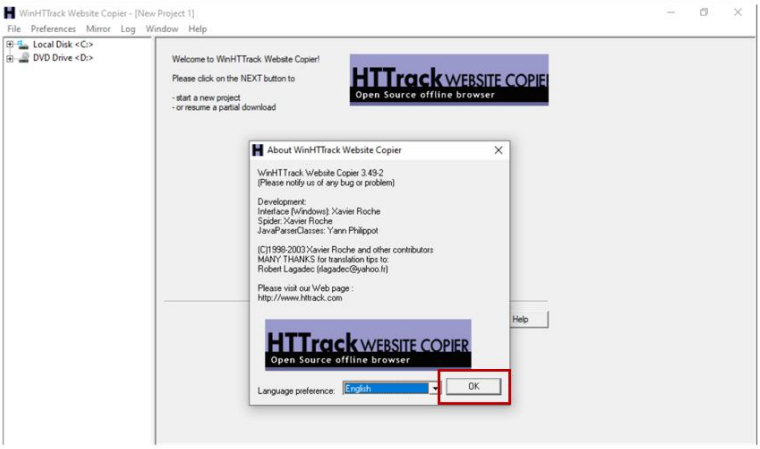

- ✅ Register WinHTTrack file types and program setup
- ✅ Create a desktop icon

Clicked **Next**. Installation completed successfully.

WinHTTrack main window launched.

After installation, the tool opened. An **"About WinHTTrack"** popup appeared showing version information. Clicked **OK** to close the popup.

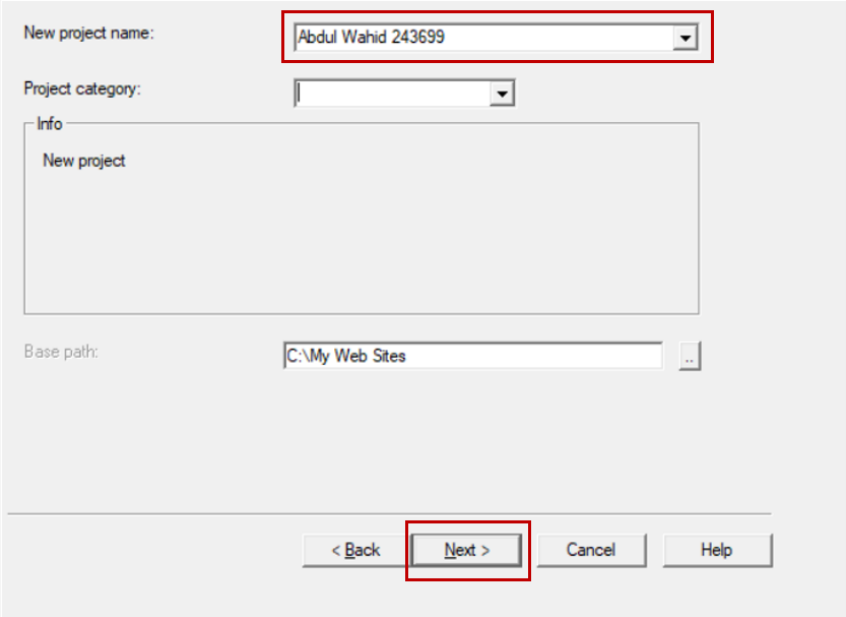

Welcome screen — started a New Project. The main welcome screen displayed the message **"Please click on the NEXT button to start a new project."** Clicked **Next** to create a new project.

Set Project Name and Base Path.

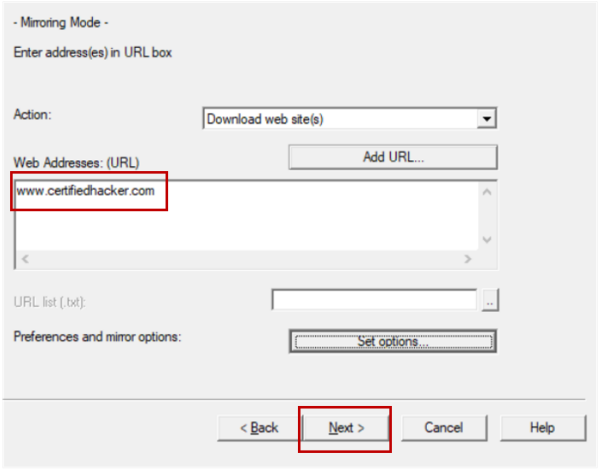

- **New project name:** Abdul Wahid 243699
- **Project category:** Left blank
- **Base path:** C:\My Web Sites (default)

Clicked **Next**.

Entered target URL and clicked Set Options.

- **Web Addresses (URL):** Entered www.certifiedhacker.com
- Clicked **"Set options..."** to configure the Scan Rules before proceeding.

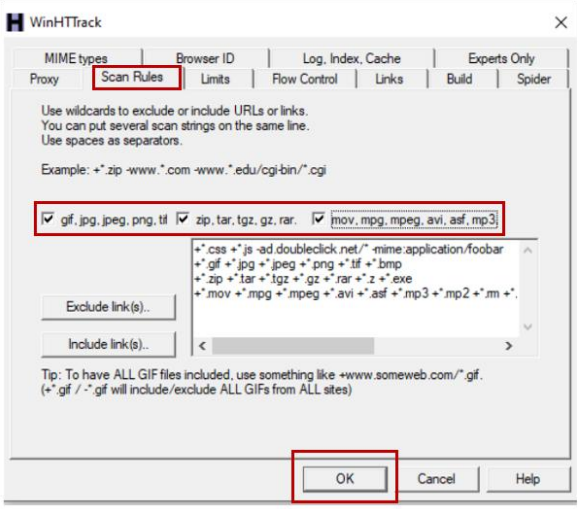

Configured Scan Rules.

Opened the **Scan Rules** tab in the WinHTTrack options window. Checked all three file type checkboxes:

- gif, jpg, jpeg, png, tif
- zip, tar, tgz, gz, rar
- mov, mpg, mpeg, avi, asf, mp3

Clicked **OK**. This ensures all media files from the website are also downloaded during mirroring.

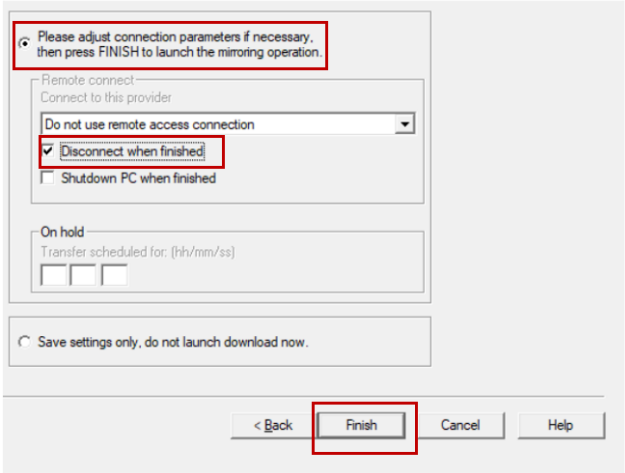

Launched the mirroring operation.

On the final screen:

- Checked **"Disconnect when finished"**
- Clicked **Finish**

The mirroring operation started and HTTrack began downloading certifiedhacker.com.

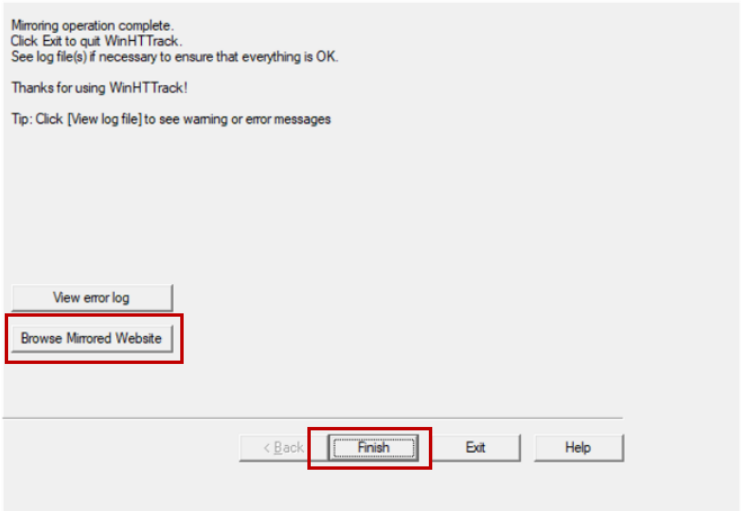

Mirroring operation completed.

The screen displayed the message: **"Mirroring operation complete."**

- **"View error log"** was available to check for any errors
- Clicked **"Browse Mirrored Website"** to view the mirrored site

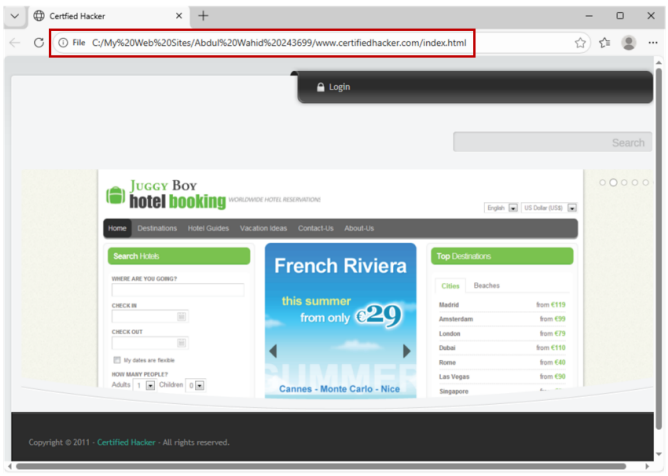

This confirmed that the website was successfully copied to the local machine

Mirrored website opened in browser.

The website opened in the browser. The address bar showed the local path:

The website was functioning exactly like the live site — the **Juggy Boy Hotel Booking** page was visible with all images and navigation intact. This proves the website was successfully mirrored locally.

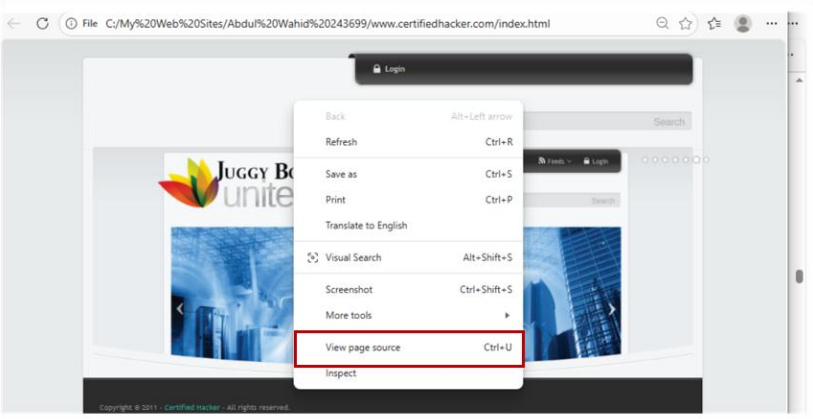

Viewed Page Source.

Right clicked on the mirrored website page → selected **"View page source"** (Ctrl+U).

The source code clearly revealed:

- HTML structure of the login form
- JavaScript references
- Image paths
- Internal links and URLs

Analyzed the source code.

The source code displayed HTML tags, form actions, CSS class names, image sources, and JavaScript references. Key findings included:

- Login form with method="post"
- Image path: images/icons/lock-and-key-110.png
- Username and Password input fields
- Register and Sign-in buttons

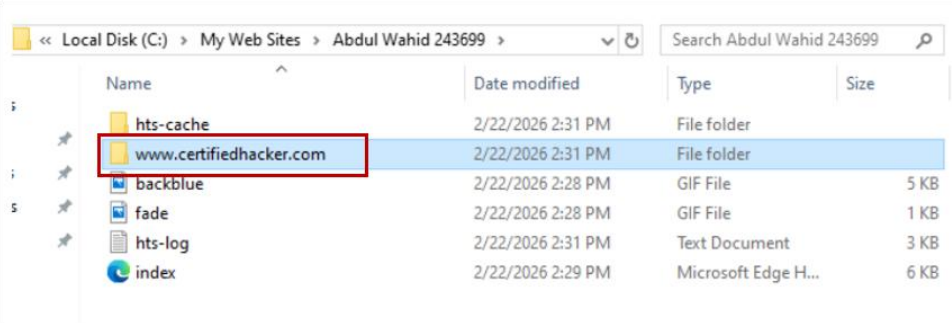

This data provides hints about the website's backend structure and can be used to identify potential vulnerabilities.

Mirrored files directory — Project folder.

Inside C:\My Web Sites\Abdul Wahid 243699\ the following files were present:

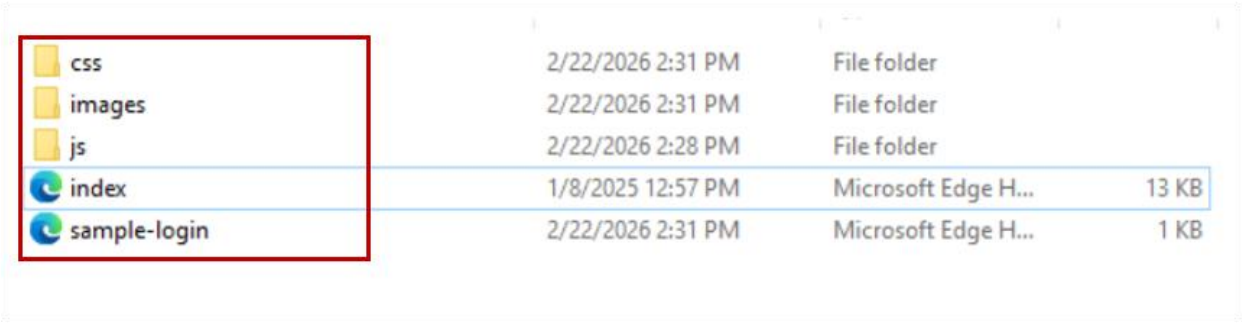

All these files were automatically downloaded by HTTrack during the mirroring process.

Internal directory structure of the website.

Inside the www.certifiedhacker.com folder, the following structure was found:

Analysis: This directory structure reveals that the website uses plain HTML, CSS, and JavaScript with no visible server-side framework. It also exposes where images and scripts are stored and which pages are accessible — valuable information for vulnerability assessment and threat intelligence.

Conclusion

Using HTTrack Website Copier, the website certifiedhacker.com was successfully mirrored. The mirrored copy made the source code, CSS, JavaScript, images, and full directory structure available locally for offline analysis. This data allows analysts to study the website's technology stack, linked URLs, accessible pages, and metadata — which is a fundamental step in the threat intelligence collection process.

Web Data Extractor

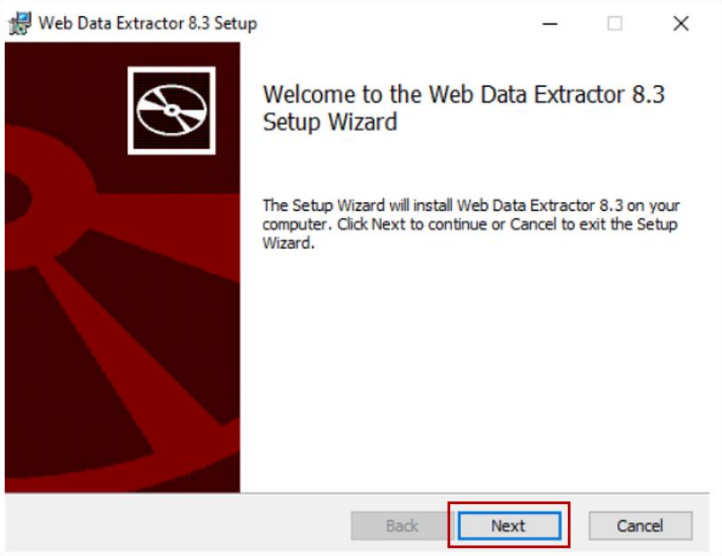

Web Data Extractor is a powerful web scraping and metadata extraction tool developed by Spadix Software. It automatically crawls a target website and extracts valuable information including meta tags (title, keywords, description), email addresses, phone numbers, fax numbers, and all URLs found on the website. It stores all extracted data in CSV or other formats for further analysis. In Threat Intelligence, this tool is used to gather organizational contact information, technical metadata, and site structure data — all of which help build a detailed profile of the target organization without direct interaction.

Objective: To extract metadata, emails, phone numbers, fax numbers, and URLs from certifiedhacker.com using Web Data Extractor 8.3 for organizational reconnaissance and threat intelligence purposes.

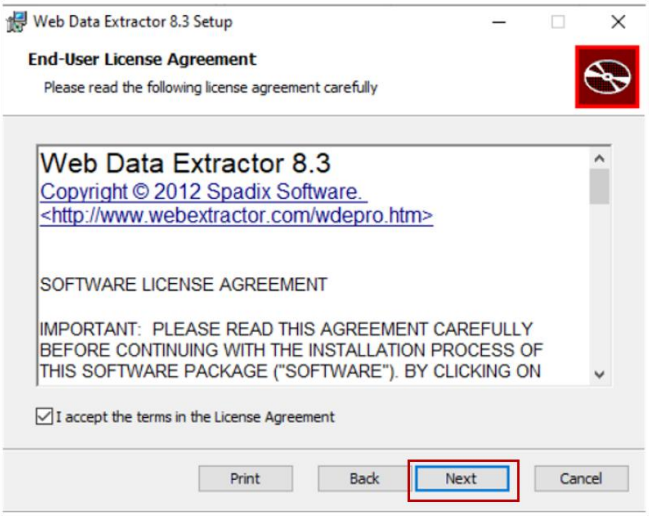

Web Data Extractor setup wizard launched.

The Web Data Extractor 8.3 Setup Wizard opened. The wizard confirmed it would install the tool on the computer. Clicked **Next** to proceed with the installation.

End-User License Agreement screen.

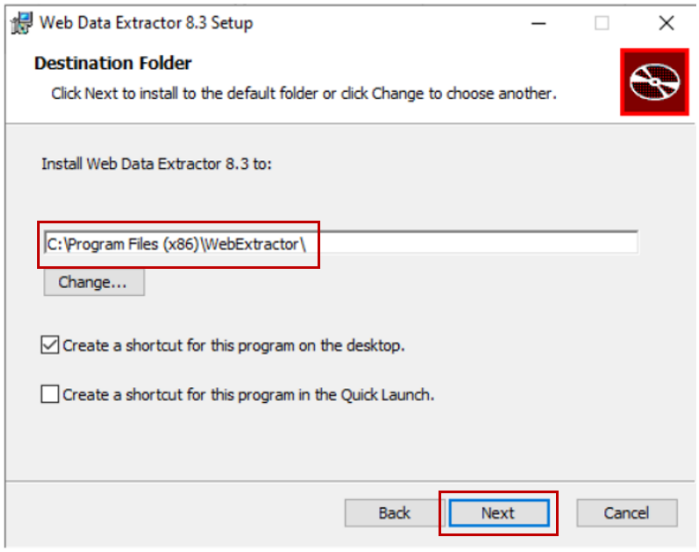

The license agreement for Web Data Extractor 8.3 (Copyright © 2012 Spadix Software) was displayed. Checked **"I accept the terms in the License Agreement"** and clicked **Next**.

Destination Folder selected.

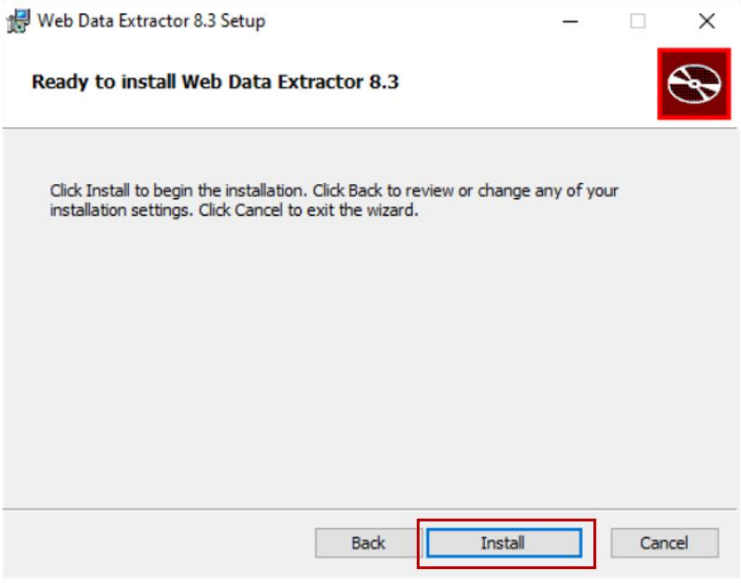

The default installation path was set to C:\Program Files (x86)\WebExtractor

Kept the default path and clicked **Next**.

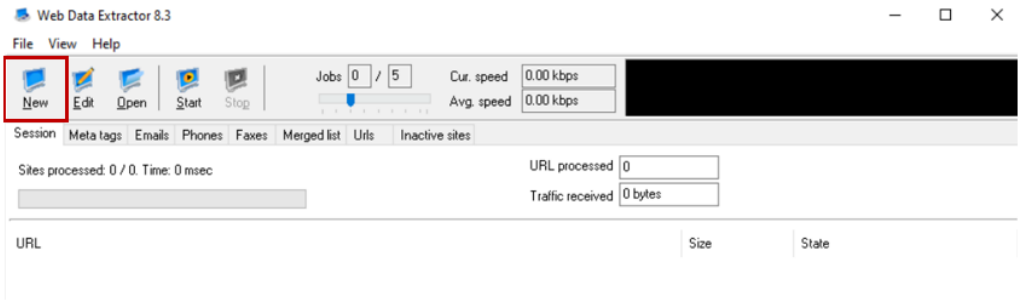

Ready to Install screen.

Clicked **Install** to begin the installation process.

Web Data Extractor main window launched.

After installation, the Web Data Extractor 8.3 main window opened. The interface showed tabs for Session, Meta tags, Emails, Phones, Faxes, Merged list, URLs, and Inactive sites. Clicked **New** to start a new extraction session.

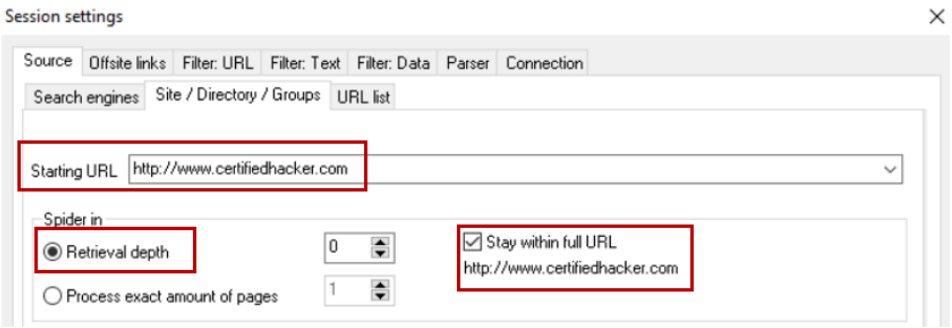

Session Settings configured — Part 1.

The Session Settings window opened. Entered the target URL:

- **Starting URL:** http://www.certifiedhacker.com
- **Spider in:** Retrieval depth set to **0**
- **Stay within full URL:** Left unchecked at this stage
- **Save data folder:** C:\Program Files (x86)\WebExtractor\Data\certifiedhacker.com

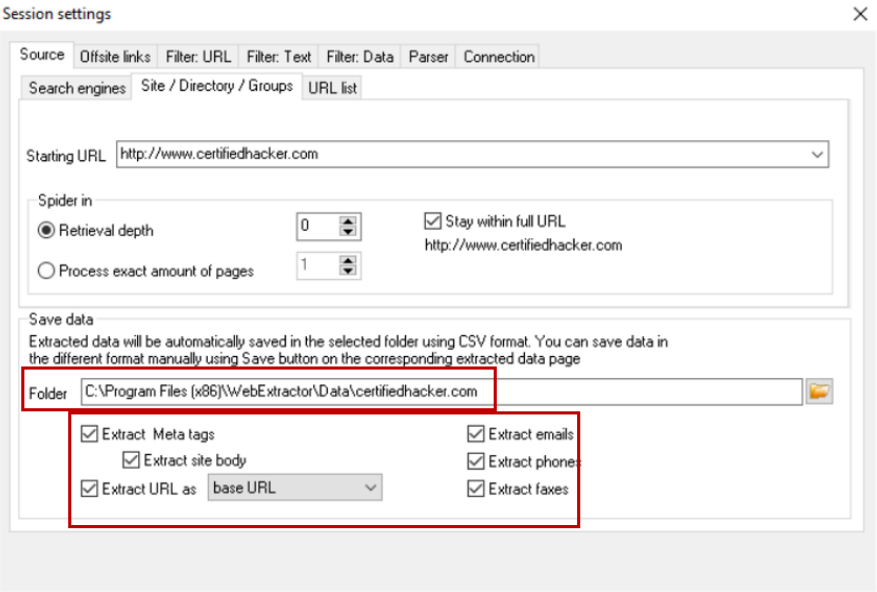

Clicked **OK** to proceed.

Session Settings configured — Part 2 (Final).

Returned to Session Settings and enabled all required extraction options:

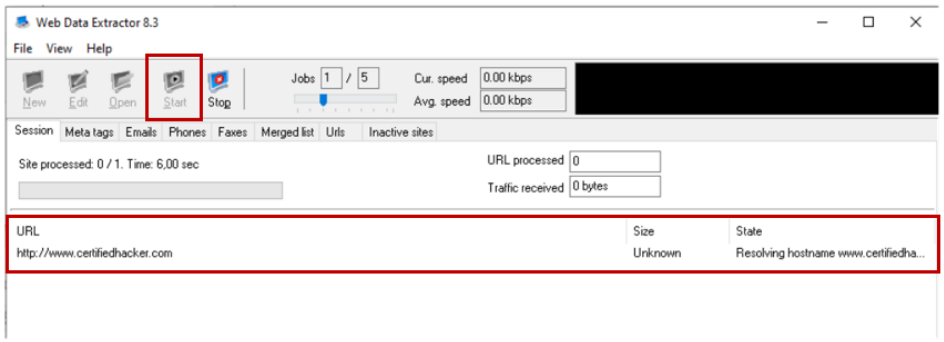

All options confirmed. Clicked **OK** to finalize the session configuration.

Data extraction started.

Clicked **Start** to begin

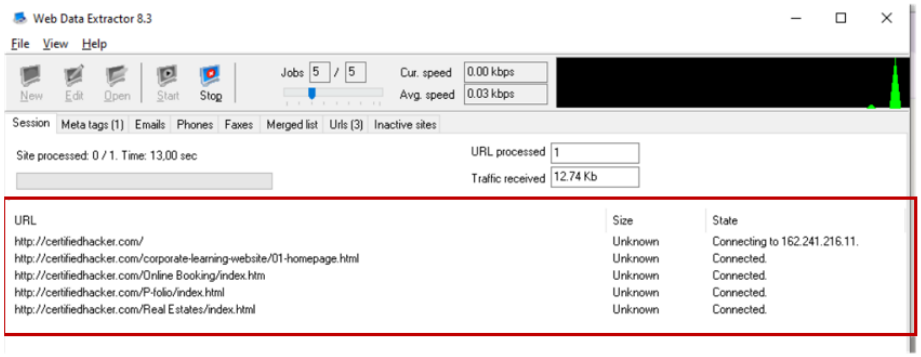

The tool began crawling the website automatically.

Extraction in progress — URLs being crawled.

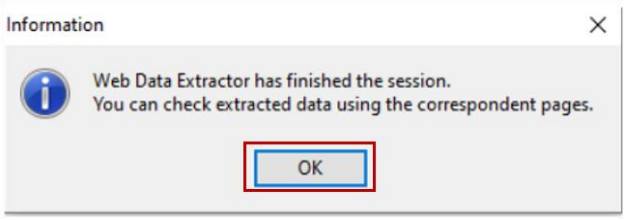

The tool was actively crawling multiple pages of certifiedhacker.com.

Stats showed: Traffic received: 12.74 Kb, URL processed: 1, Jobs running: 5/5.

Extraction session finished.

Clicked OK to dismiss the popup.

Extraction results summary visible in tabs.

After the session completed, the tabs at the top showed the total count of extracted data:

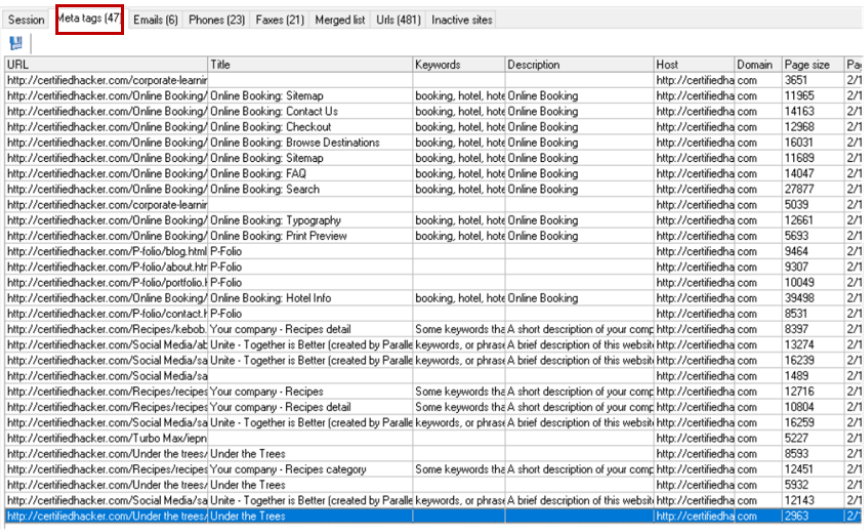

This summary confirms the volume of intelligence gathered from a single website crawl.

Meta tags tab reviewed.

Clicked on the Meta tags (47) tab to view extracted metadata

This metadata reveals the website's page structure, SEO keywords, and organizational services — critical for building a threat intelligence profile.

Session saved.

went to File → Save session to save the completed extraction session. The Save session option was selected from the File menu dropdown.

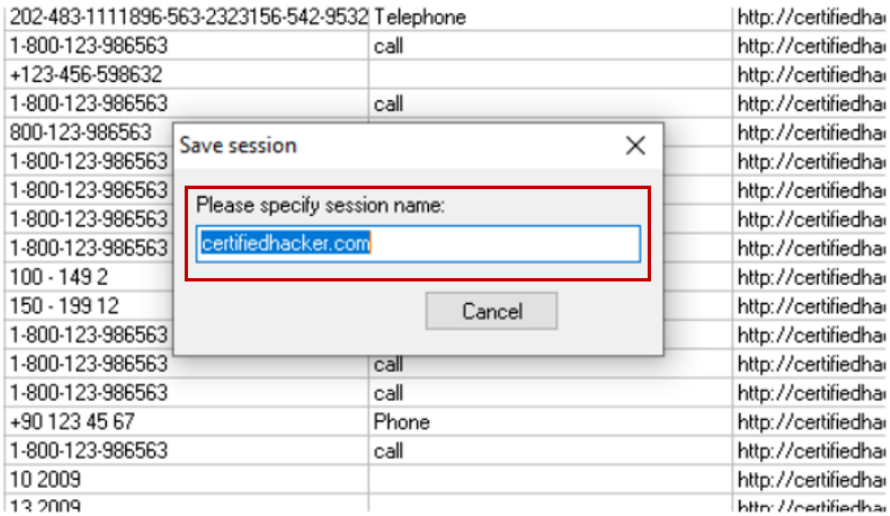

Clicked Save to export the data in CSV format.

Session name specified and saved.

clicked OK to save the complete extraction session for future reference

Conclusion

Using Web Data Extractor 8.3, a comprehensive metadata extraction was successfully performed on certifiedhacker.com. The tool extracted 47 meta tags, 6 email addresses, 23 phone numbers, 21 fax numbers, and 481 URLs in a single automated session. This gathered intelligence — including contact details, page structure, and keywords — provides a detailed organizational profile that is essential for threat intelligence analysis, attack surface mapping, and identifying potential social engineering vectors.
